Mecaflux Crack Torrent.rar

Mecaflux Heliciel.rarQ: Parsing a complex input in Python I've got an input as a string that is like `#FirstSection#LetsTakeThisAsADictString ['a:1:{s:5:"name";s:5:"b";}', 'c:1:{s:5:"name";s:4:"xyz";}']` I'm trying to get the dict values out of it using regex, like `>>> re.findall(r'(\w+):(d+)', myStr) ['a:1:{s:5:"name";s:5:"b;}', 'c:1:{s:5:"name";s:4:"xyz";}']` But I'm now finding that it is also capturing this in the first section and I'm getting an extra '[' , '] at the start and end. So, I'm looking for something that will just get me the dict values as strings. I'm using regex because it works, but I'm wondering if I can do this without regex. I was hoping to just do, something like `>>> re.findall(':\w+', myStr) ['a:1:{s:5:"name";s:5:"b;}', 'c:1:{s:5:"name";s:4:"xyz";}']` But obviously that won't work because of the '[' , '] in front of the dict values. A: You can't use regex to remove the starting and ending square brackets. You'll need to do some string slicing: import re match = re.findall(r'(\w+):(d+)', myStr) first_section = myStr[0:myStr.index(' ') second_section = myStr[myStr.index(' ')+1:] print 'first:', first_section print 'second:', second_section [], [], [], [], [], [], e79caf7748
